

Bespoke Ballistic Panic Rooms, Kensington, London

We were approached by a construction company who were renovating a period property in one of London's most affluent and prestigious postcodes.

The residence was already some way through its refurbishment and we were required to secure two rooms against both physical attack & ballistic weapons. Furthermore we were required to supply doors to these rooms that matched the others within the property, so as to blend in seamlessly with the period surroundings.

The complexity and sophistication of the building management systems resulted in a huge amount of cabling and ductwork within the walls floor and ceiling for us to work around. This made securing the installation very challenging since most of this infrastructure was already installed. As with many Embassy panic rooms that we fit, the rooms were upstairs on wooden floorboards and therefore weight was a constraint.

Our Research & Development team came up with a bespoke solution that met the full brief. The walling gave ballistic resistance to EN1522 FB4, which protects against the most powerful of handguns. In addition it was also designed to resist attacks with power tools, axes and sledge hammers.

We used our Janus Armoured Doors, also with FB4 ballistic protection. These heavily protected steel doors are clad with special decorative panels to give the impression of a normal domestic door. The panels can be matched to hundreds of different designs to match the surroundings of any building, old or new. These doors are independently tested and certified to the European Burglary Resistance Standard EN1627 RC4. They have a double lock on them which is quick and very simple to manually operate in the event that you are under threat. All of the locks and cylinders are tested and certified to the highest European standards for attack resistance EN12209 & EN1303 and the keys are protected against copying.

Kensington, London

Burton Safes Process

Sales Team

You will have a dedicated sales manager to work with you to discuss your requirements and find the right solution. Our sales team have a vast knowledge of the security industry and will ensure the solution is right for you.

Design Team

After detailed discussions to assess your requirements our design team will work on your solution, ensuring it meets the required security level.

Janus Panic Armoured Doors

CAD Design

Our in-house CAD design team will create drawings of your security solution allowing you to visualise the end result. Once your project is signed off we will begin the manufacturing process.

Precised Engineered

Each project is handled by a dedicated project manager who will ensure a smooth process and that deadlines are met.

Janus Panic Armoured Doors

Installations

Surveys and installations are carried out by our own engineering team. These are arranged with you in advance by the project manager.
